UC San Francisco Assistant Professor of Psychiatry and Pediatrics Nicki Bush, PhD [2], was recently invited to serve a guest editor for a special issue of the journal Psychosomatic Medicine. The issue, titled "Mechanisms Linking Early-Life Adversity to Physical Health," [3] was published late last year.

Psychosomatic Medicine, founded in 1939, is the official peer-reviewed journal of the American Psychosomatic Society [4]. It publishes experimental and clinical studies dealing with various aspects of the relationships among social, psychological, and behavioral factors and bodily processes in humans and animals.

The issue focused on articles exploring the forces driving the extensively researched association between exposure to adverse childhood experiences (poverty, neglect, abuse, and violence) and elevated risk for poor health outcomes later in life. Among the questions
explored were whether the mechanisms linking adversity to later health outcomes were universal or specific, if particular periods in development were more sensitive in terms of exposure to adversity, and if altered development after experiencing adversity reflect a true dysfunction or an adaptation for survival.

"Understanding these pathways is of obvious general scientific interest, but moreso because such knowledge is needed to inform the development of novel interventions to prevent the onset of health problems following adversity," explained Bush in a podcast offering further insight [5] into the special issue.

"People tend to focus on health behaviors as a primary factor in the etiology of physical health, and although health behaviors clearly play an important role, a number of longitudinal studies have shown that early-life adversity is associated with poor physical health even after you adjust for the effects of health behaviors like smoking, alcohol use, and physical activity."

"This suggests that other critical mechanisms are involved in the pathway from early-life adversity to poor health," Bush continued, "and that is what we wanted to help unpack through the work in this special issue."

Also serving as guest editors for the special issue were the University of Washington's Katie McLaughlin, PhD, and Richard Lane, MD, PhD, from the University of Arizona. Authors of research presented in the issue from UCSF included Melissa Hagan, PhD, MPH [6]; Danielle Roubinov, PhD [7]; Nancy Adler, PhD [8]; W. Thomas Boyce, MD [9]; and Bush.
